## EXERCISE INSTRUCTIONS

Exercise is beneficial to your health, improves physical condition, shapes muscles and, in combination with a calorie-balanced diet, leads to weight loss.

### 1. WARM UP

This phase serves to improve the blood circulation of the whole body and to warm up the muscles, to reduce the risk of convulsions and muscle injury. We recommend performing the stretching exercises below. When dragging, stay in the end position for approximately 30 seconds, do not make sudden movements and do not vibrate.

## 2. EXERCISING

This phase is the most physically demanding part. Regular exercise strengthens the muscles. You can determine the tempo yourself, but it is very important that it is the same throughout the exercise. Heart rate should be within the target zone (see figure below).

**This phase should last at least 12 minutes. Most people exercise for 15-20 minutes.**

## 3. COOLDOWN

This phase serves to soothe the cardiovascular system and relax the muscles. It should take approximately 5 minutes. You can repeat warming up exercises or continue exercising at slower pace. Stretching your muscles after exercise is extremely important - you need to avoid sudden movements and vibrations.

With improved fitness, you can lengthen and increase exercise intensity. Train regularly, at least three times a week.

## SHAPING MUSCLES

For muscle shaping, it is important to set a high load. The muscles will be more stressed, which may cause that you will not be able to exercise as long as usual. If you are trying to improve your condition at the same time, you need to adjust your training. Exercise in the usual way during the warm-up and final stages of training but increase the resistance of the device at the end of the exercise. You may need to slow down the speed to keep the heart rate in the target area.

## WEIGHT LOSS

The number of calories burned depends on the length and intensity of the exercise. The essence is the same as in fitness exercise, but the goal is different.
